

Process for the chemical and thermal disinfection

The present invention relates to the use of a composition which contains 1-(2-ethylhexyl)glycerol ether for thermochemical disinfection.

Mechanical disinfection methods are employed for disinfecting instruments especially in the clinical sector. In these, an aqueous composition is allowed to act, normally at elevated temperature, on the surface to be disinfected, cf. Anforderungen an die Hygiene bei der Aufbereitung bei Medizinprodukten, Bundesgesundheitsblatt 44 (2001), 1115-1126.

Preparations currently employed in thermochemical disinfection methods can be roughly divided into three groups:

- Compositions which contain short-chain organic acids such as formic acid, acetic acid or citric acid.

The effect of such monobasic or polybasic acids is disclosed inter alia in EP-A-0 505 763 and AT-A-382 310, see also Hygiene + Medizin 1989, 14, pages 69 et seq., GB-A-2 103 089 and Tierärztliche Umschau 1988, 43, pages 646 et seq. It is additionally proposed in DE-C2-42 00 066 to employ a 1.5% by weight aqueous solution of citric acid, optionally with the addition of malic acid or lactic acid, to inactivate hepatitis B viruses. However, a disadvantage which has emerged is that such disinfectants necessarily have a low pH and accordingly, especially when relatively high temperatures are used for disinfecting instruments, act as strong corrosives.

- Compositions which contain quaternary ammonium compounds.

These have proved, especially in disinfectants with a

very high alcohol content, e.g. in anhydrous isopropanol/n-propanol or 80% strength ethanol, to be effective hand disinfectants (see, inter alia, Wallhäußer, Praxis der Sterilisation, Henkel Chemische Bibliothek, 4th edition, 1988, pages 75 et seq.).
5 Disinfectants with a high alcohol content are, however, unsuitable for disinfecting instruments because they attack synthetic materials. In addition, disinfectants containing quaternary ammonium compounds are highly
10 foaming, which restricts their use, especially for disinfecting instruments.

➤ Compositions which contain aldehydes such as formaldehyde, acetaldehyde and glutaraldehyde.

15 Aldehyde-containing disinfectants have been unwanted for some years because of the harmful effects on human health, especially of formalin, and because of their unpleasant odour.

20 Many materials (e.g. metal) of the surfaces of instruments (e.g. endoscopes) are moreover resistant to the agents used in known compositions for thermochemical disinfection for only a limited time and in a limited
25 temperature range. Thus, known solutions used for thermochemical disinfection lead, at the temperatures necessary for use, to corrosion of the surfaces of treated articles, e.g. to rusting of metal, to hazing
30 of glass, plastic or ceramics or to brittle synthetic materials. Replacement of the agents, lowering the concentration used and/or lowering the disinfection temperature are, however, subject to restrictions because the surface must be dependably cleaned and
35 reliably disinfected and moreover a large number of microorganisms must be eliminated.

The disinfectant solutions conventionally employed, and corresponding concentrates, have disadvantages, however:

1. Many known agents are costly, leading to the respective disinfection method being uneconomic, especially if it is necessary to use high concentrations.
5
2. The known solutions for use must (i) contain comparatively high concentrations of agents, (ii) be employed at comparatively high temperatures and (iii) for a comparatively long time for dependable elimination of all relevant microorganisms. These three parameters are not unrestrictedly consistent with material-conserving disinfection and may lead to stress for the staff and/or environment from the solutions used.
10
15
3. Disinfectant concentrates are often not stable at low temperatures or on storage and are prone to discoloration and to foaming of the solutions prepared for use by dilution with water. To preclude these disadvantages of the concentrates it is necessary to add to the concentrates auxiliaries which are likewise subject to the restrictions described for the agents.
20
25
4. Many agents require the addition of appropriate auxiliaries for it to be possible to handle the agents in solutions diluted for use (and for example to afford solutions for use which are clear in the use concentration).
30
5. Many agents are effective only for certain microorganisms. The formulation of disinfectants (solutions for use, concentrates) with three or more components in order to ensure efficacy for all relevant microbes leads to additional problems, however.
35
6. Many agents are unacceptable as residues even in

small quantities, which is why careful rinsing of the disinfected surface with water is necessary. This procedure is uneconomic, time-consuming, of low environmental compatibility and may lead
5 through the rinsing water to recontamination with unwanted microorganisms.

The Patent DRP 649 206 of 5 August 1937 relates to a disinfection method in which a glycerol monoalkyl ether
10 is used as aqueous solution or emulsion, for example for disinfectant treatment of equipment in the food and other consumables industries. The glycerol monoalkyl ethers specifically disclosed are glycerol monododecyl ether, glycerol monodecyl ether, glycerol mono-octyl
15 ether, glycerol monobenzyl ether, diglycerol mono-octyl ether, glycerol monocyclohexyl ether, and a mixture of glycerol mono-octyl, monodecyl and monododecyl ethers. However, at room temperature, glycerol ethers without other agents have virtually no effect on microorganisms
20 or have an effect only with long exposure times - but even then only inhibit microbial growth rather than actually kill microbes.

DRP 649 206 further states that dialkyl ethers of
25 glycerol can be used with equal success. However, the only effect described is for selected glycerol ethers at 50°C and on the yeast *Mycoderma* and the mould *Oidium lactis* (first table) and on thermobacteria, acetic bacteria, *Penicillium*, *Oidium*, *Mycoderma* and cultivated
30 yeast (second table). The test methods are not disclosed. All the bacteria and fungi mentioned in the patent are important in the manufacture of food products where killing with a disinfectant is also occasionally necessary. They are not, however, patho-
35 gens and are therefore of no significance in hospitals or medical practices.

Following the teaching of DRP 649 206 and testing the activity of the glycerol ethers disclosed therein using

present-day test methods reveals virtually no effect on microbes of hygienic relevance (such as the tubercle bacillus). An additional factor is that the compounds disclosed in DRP 649 206 are, for various practical reasons, useless for a modern (mechanical) thermochemical disinfection method.

For example, mono-octyl glycerol ether is associated with the disadvantages that the ether when dissolved in water gives a solution which is always turbid and - which is particularly disadvantageous for modern mechanical thermochemical disinfection methods - highly foaming. DRP 615 171 of 6 June 1935 in fact emphasizes the foam-stabilizing effect in this connection (cf. lines 56 et seq. therein). This has been confirmed for 1-(n-octyl)glycerol ether by the experiments carried out for the purposes of the present invention, which are detailed in the example section.

Dialkyl ethers of glycerol, e.g. dioctyl glycerol ethers, have no solubility in water and are unsuitable for the present object.

Accordingly, no compositions containing glycerol ethers for thermochemical disinfection are known to be on the market, and the monoalkyl glycerol ethers mentioned in DRP 649 206 are not available in commercial quantities. This can also be explained by hindsight and on the basis of the present invention by the facts that glycerol ethers display no microbicidal activity at room temperature in acceptable use concentrations, whereas the compositions conventionally used for thermochemical disinfection methods are effective even at room temperature, and the activity was merely improved by raising the temperature. Compositions displaying a very steep temperature gradient (starting from a low or absent activity at room temperature) are not generally known on the market.

DE-A-40 26 756 relates to preservatives which contain as synergistic agents a mixture of a) an organic acid, b) a monophenyl glycol ether and c) a guanidine derivative. Examples 13 and 14 are concentrates with more than 60% by weight of phenoxyethanol and respectively 15 and 10% by weight of glycerol monoalkyl ether. The preservatives in DE-40 26 756 are effective for various bacteria and yeasts. The applicant's post-published DE A-102 24 979 discloses mixtures of glycerol ethers with aromatic alcohols for controlling mycobacteria. Use of the mixtures at elevated temperature is not described.

DE-A-41 40 474 relates to the use of glycerol monoalkyl ethers as refatting skincare additives. DE-A-100 25 122, DE-A-100 25 123 and DE-A-100 25 124 disclose preparations having a content of glycerol monoalkyl ether. The preparations are used for preserving cosmetic and dermatological preparations. DE-C-42 40 674 discloses that glycerol monoalkyl ethers of the formula $R-O-CH_2-CHOH-CH_2OH$ have a deodorant effect. DE-C-41 40 473 discloses compositions which can be used as skin antiseptics and hand disinfectants and which contain a combination of an aliphatic C_1 - to C_6 -alkyl alcohol component and at least one glycerol monoalkyl ether in aqueous solution, and further states that the use of glycerol monoalkyl ethers in preparations containing considerable quantities of water is entirely inadequate without further additions which likewise have antimicrobial activity.

DE-A-41 24 664 describes mixtures having antimicrobial activity and containing a synergistic combination of aryl-substituted alkanol with diol. Exemplary diols are glycerol monoalkyl ethers. The mixtures are used to preserve aqueous preparations of substances susceptible to microbial degradation (oils, fats, proteins, carbohydrates or derivatives thereof).

The present invention was thus based on the object of providing a composition for thermochemical disinfection of surfaces of articles such as instruments and thermolabile materials, which satisfies the stated requirements and avoids the disadvantages of the state of the art. The object was in particular to provide for a (mechanical) thermochemical disinfection method a composition which

10 ➤ does not attack or attacks negligibly materials used in the hospital sector as surfaces of articles and which must be disinfected, also above room temperature, and

15 ➤ has no irritant or defatting effect on contact with human skin (that is, does not necessarily have a high content of lower alcohols such as ethanol or isopropanol).

20 It has now surprisingly been found according to the invention that 1-(2-ethylhexyl)glycerol ether has an exceptionally steep temperature gradient of the microbicidal effect. The invention is thus based on the possibility of using a composition which contains
25 1-(2-ethylhexyl)glycerol ether for disinfecting the surface of an article at a temperature above room temperature (room temperature defined as 25°C), preferably a temperature of 30°C or above, more preferably 35°C or above, in particular 40°C or above, most
30 preferably 50°C or above.

In one embodiment, the disinfection is carried out without elevated pressure. The disinfection temperature in this case is preferably 40 to 80°C, more preferably
35 45 to 60°C, in particular 45 to 55°C, for example about 50°C.

In a further embodiment of the invention, the disinfection is carried out under elevated pressure. The

disinfection temperature in this case is up to 170°C and is preferably in the range from 80 to 160°C, more preferably 100 to 150°C, in particular 120 to 140°C, for example 130 to 135°C. At present, a maximum
5 temperature of 134°C for a period of 20 minutes is regarded as adequate for example for the inactivation of prions, in the case of thermal inactivation.

A sterilization (eradication of viable microbes) of
10 inanimate surfaces above 100°C can take place for example in an autoclave with superheated, saturated steam or a steam/air mixture under elevated pressure. Thus, for example, a steam sterilization or autoclaving can take place at a minimum of 120°C, corresponding to
15 a gauge pressure of 1 bar, acting for a time of from 15 to 20 minutes with the addition of a composition according to the invention.

The use takes place on inanimate surfaces, e.g. during
20 the thermochemical disinfection and/or cleaning of instruments, thermostable materials and thermolabile materials, such as endoscopes.

The use according to the invention can take place by
25 wetting, spraying, rubbing, wiping or moistening the surface with the composition, dipping the surface into the composition, or disinfecting the surface by atomizing the composition. The treated surface of the article in this connection is any inorganic or organic
30 material, in particular a thermosensitive material, for example made of metal, glass, wood, plastic, textile or ceramic. The article may be a medical instrument or laboratory apparatus, a product system or a part thereof, for example a pipeline or a storage tank, a
35 foodstuffs container such as a bottle, a product which is subject to the Medical Appliances Act, an air-conditioning system, a membrane, an ion exchanger or a cooling water circulation. The use takes place for example in the manual and mechanical disinfection and

preparation of medical instruments and appliances, especially thermolabile instruments such as flexible endoscopes.

5 The use referred to here as disinfection may be any cleaning, preservation, sterilization, instrument preparation, system disinfection or maintenance, but is preferably a mechanical use. The disinfection time is, for example, 10 seconds to 1 hour, more preferably
10 1 minute to 30 minutes, in particular 5 to 15 minutes.

The thermochemical disinfection of instruments, especially of thermolabile instruments such as flexible endoscopes, is carried out in special automatic cleaning and disinfecting systems. An example of a programme
15 procedure according to the invention, in which the composition is advantageously employed in the form of an instrument disinfectant, is as follows:

- 20 1. where appropriate precleaning with cold water,
2. cleaning at 55 to 60°C with a neutral cleaner (e.g. as 0.5% strength solution),
- 25 3. thermochemical disinfection at 55 to 60°C acting for a time of from 1 to 20 minutes, e.g. about 5 minutes, with a disinfectant (e.g. 1 to 3% strength based on a concentrate),
- 30 4. rinsing with cold water and
5. drying.

An alternative method includes the steps of:

- 35
- 1) where appropriate precleaning with cold water,
 - 2) cleaning with a neutral cleaner, raising the temperature to 90 to 100°C, preferably 90 to

95°C, such as about 93°C,

- 3) thermochemical disinfection at 90 to 100°C,
preferably 90 to 95°C, such as about 93°C,
5 acting for a time of from 1 to 20 minutes with
the composition,
- 4) rinsing with water and
- 10 5) drying, where appropriate at 40 to 60°C.

The statements concerning the thermochemical disinfection according to the invention preferably relate to step 3 of the method described above.

15 The composition employed according to the invention contains, besides (a) 1-(2-ethylhexyl)glycerol ether, where appropriate (b) one or more further agents. Examples of further agents are aldehydes, amines,
20 phenols, halogen compounds and carboxylic acids, and aromatic alcohols, preferably o-phenylphenol, triclosan, o-phthalaldehyde, Lonzabac 12 and Lonzabac LF. A particularly preferred further agent is citric acid (e.g. as monohydrate). The composition
25 (concentrate, solution for use) where appropriate contains no aromatic alcohol.

Besides component (a) and, where appropriate component (b), the composition may contain further components
30 such as (c) one or more auxiliaries. However, it preferably has a low surfactant content and contains less than 5% by weight of surfactant, more preferably less than 2% by weight, particularly less than 0.5% by weight of surfactant, and particularly preferably is
35 free of surfactant (the percentage data are based on the concentrate).

Possible auxiliaries are wetting agents, cleaning components, corrosion inhibitors, surfactants (nonionic

surfactants, anionic surfactants, amphoteric surfactants), buffers, acids, alkalizing agents, perfumes, dyes, salts, indicators, markers, complexing agents and antifoams. Exemplary auxiliaries are sodium chloride or sodium hydroxide.

Although concentrates are normally liquid, it is possible to produce pasty or solid concentrates by suitable procedures. In one embodiment of the invention, the composition which is used is in the form of a liquid concentrate and is diluted with water to an aqueous solution for use. Such a concentrate contains, for example, (a) 1 to 20% by weight, such as 2 to 10% by weight, of 1-(2-ethylhexyl)glycerol ether and, where appropriate, up to 40% by weight of water. The skilled person is able to formulate appropriate water-dilutable concentrates with the assistance of suitable auxiliaries such as solvents (glycols such as propylene glycol), solubilizers, acids, alkalizing agents or surfactants. A preferred concentrate is anhydrous.

In another embodiment, the composition is employed as aqueous solution for use and then contains (a) 0.01 to 1.0, more preferably 0.025 to 0.5, in particular 0.05 to 0.2, particularly preferably about 0.1, % by weight of 1-(2-ethylhexyl)glycerol ether and, where appropriate, (b) 0.1 to 15, more preferably 0.5 to 10, in particular 1 to 5, % by weight of one or more further agents. Such a solution for use may contain 80% by weight or more, more preferably 89.5 to 99.45% by weight, in particular 94.9 to 98.9% by weight, of water. Solutions for use preferred in this connection have a pH of from 3 to 10.

A particularly preferred concentrate contains 40 g of citric acid monohydrate, 36 g of deionized water, 20 g of 1,2-propylene glycol and 4 g of 1-(2-ethylhexyl)-glycerol ether. To produce it, the ingredients are stirred until homogeneous at room temperature. A clear

colourless liquid is obtained, it being possible to prepare, by dilution of 1 part by weight of concentrate with, for example, 40 parts by weight of water, a clear, 2.5% by weight solution for use which contains
5 1% by weight of citric acid monohydrate and 0.1% by weight of 1-(2-ethylhexyl)glycerol ether. Accordingly, the use of an aqueous solution for use which comprises (a) 0.05 to 0.2% by weight, such as about 0.1% by weight, of 1-(2-ethylhexyl)glycerol ether and (b) 0.5
10 to 2.0% by weight, such as about 1% by weight, of citric acid monohydrate is particularly preferred.

In a further embodiment, the composition contains salt. For example, salt-containing compositions may make it
15 possible to control the agent concentration via the electric conductivity. For the inactivation of prions, so-called chaotropic salts are additionally employed. Corrosion-inhibiting salts are able to improve the material compatibility of the compositions.

20 In the use according to the invention of the composition, the skilled person will choose an optimum between the parameters of use time, concentration of 1-(2-ethylhexyl)glycerol ether and, where appropriate,
25 the components (b) and/or (c), and disinfection temperature, which is consistent with the desired disinfectant action, depending on the sensitivity of the material to be disinfected.

30 Use of the composition leads to elimination of bacteria (gram-positive and gram-negative), yeasts and moulds, microbacteria and viruses, for example propionibacteria (*Propionibacterium acnes*), dandruff-causing microbes (*Malassezia furfur*), prions, enveloped and/or
35 non-enveloped viruses, odour-causing microorganisms, lower harmful organisms, protozoa and spores.

Results of tests prove that Sensiva SC 50 has a better effect than the glycerol mono-octyl ether disclosed in

DRP 649 206. Moreover, 1-(2-ethylhexyl)glycerol ether has further advantages:

- 5 ➤ The substance is economic to use because of the low concentration necessary for use.
- The substance is listed in ELINCS and is commercially available worldwide.
- 10 ➤ The substance has a high purity (< 99%) and has been thoroughly investigated and assessed toxicologically.
- The substance can be stabilized by adding very small
15 amounts (500 ppm) of vitamin E and is thus stable on storage and contains or forms no degradation products which are toxicologically objectionable, perceptible through odour or material-damaging (formaldehyde, peroxides, 2-ethylhexanol).
- 20 ➤ The substance is colourless, has a faint odour, is virtually involatile (boiling point < 285°C) and is readily soluble in water (0.18% by weight in water).
- 25 In the use according to the invention, the compositions in the form of concentrates have the following advantages:
- They can be formulated as liquids and with a high
30 agent content and thus have advantages in terms of handling and cost which would not apply to a concentrate with a high water content.
- The concentrates show good colour stability.
- 35 ➤ The concentrates show a broad spectrum of action even when used in low concentration.
- The concentrates are stable at low temperature and

are also liquid, pumpable and easily meterable at low temperatures (even at -5°C).

- 5 ➤ 1-(2-Ethylhexyl)glycerol ether is miscible and compatible in wide ranges with numerous further agents and auxiliaries.
- 10 ➤ 1-(2-Ethylhexyl)glycerol ether acts as wetting agent and assists the disinfectant action also at corners and edges of the surface of the article.
- 15 ➤ 1-(2-Ethylhexyl)glycerol ether is a substance which has been thoroughly investigated toxicologically and has good compatibility with materials in the solution for use.
- 20 ➤ 1-(2-Ethylhexyl)glycerol ether has a high boiling point and high flashpoint, and thus handling the concentrates poses few problems.

The aqueous solutions for use are:

25 clear, colourless,
 low-foaming,
 odour- and pH-neutral,
 effectively wetting and
 oxidation-, pH- and temperature-stable.

30 The advantages of the present invention are also evident from the following examples:

Examples

35 Materials used:

SC 50 = 1-(2-Ethylhexyl)glycerol ether, Sensiva SC 50
POE = Phenoxyethanol
Water = Deionized water

All percentage data are, unless otherwise indicated, in % by weight.

Test 1: Activity of disinfectants on bacteria and yeasts

5

Reduction factors were obtained with various solutions for use (SA = *Staphylococcus aureus*, PA = *Pseudomonas aeruginosa*, EC = *Escherichia coli*, CA = *Candida albicans*, AN = *Aspergillus niger*, MT = *Mycobacterium terrae*), initial microbe count $0.8-5 \times 10^9/\text{ml}$, for CA $2 \times 10^7/\text{ml}$, neutralizer Tryp-NaCl-TLSH (No. 22). Concerning the activity on *Mycobacterium terrae*, cf. Test 2.

15 Method:

0.1 ml of the microbe suspension in CSL is thoroughly mixed at room temperature with 10 ml of the disinfectant dilution to be tested (in water of standardized hardness, WSH). After acting for times of 5, 15, 30 and 60 minutes, 1 ml samples of the disinfectant/microbe mixture are taken and transferred into 9 ml of inactivation liquid (0.1% tryptone + 0.85% NaCl in double-distilled water + inactivators). After a contact time not exceeding 30 minutes in the inactivation liquid, dilutions (10^{-2} and 10^{-4} in 0.1% tryptone + 0.85% NaCl in double-distilled water) are made up. 0.1 ml samples of the inactivation liquid and the two dilutions are then transferred by spatula onto 3 CSA plates for each. As a control, the respective test microbe suspension is mixed with 10 ml of WSH in place of disinfectant. Subcultures are to be set up from this batch in the same way in parallel with the corresponding action times.

35

All subcultures are incubated at 37°C for 48 hours, in the case of *Candida albicans* at 37°C for 72 hours, and the colonies are counted. The reduction is calculated as follows: CFU between 20 and 300 per CSA plate are to

be evaluated. After determination of the arithmetic mean of three values, the disinfectant effect (GR_t) per unit time is calculated from the formula $GR_t = \log_{CFU(co)} \text{ minus } \log_{CFU(D)}$ in which $CFU(co)$ is the number of CFU per ml without exposure to the product, and $CFU(D)$ is the number of CFU per ml after exposure to the product.

Test 2: Activity of disinfectants on *Mycobacterium terrae* at room temperature

10

Various aqueous disinfectants were tested for their activity on *Mycobacterium terrae*, microbe count 1 to 3×10^9 in a quantitative suspension test without stress. The *Mycobacterium terrae* (ATCC15755) quantitative suspension test of the Deutsche Gesellschaft für Hygiene und Mikrobiologie of 30 April 1997 was used (Hyg. Med. 22, 1997, No. 6, pages 278 et seq.). The following reduction factors were measured in this, with a reduction factor of > 5 corresponding to adequate activity. The aqueous solutions for use were tested after acting for a defined period. Because of the great structural similarity of *Mycobacterium terrae* with *Mycobacterium tuberculosis*, the results of the activity tests with *Mycobacterium terrae* also provide information on the activity for *Mycobacterium tuberculosis*.

15

20

25

Test 3: Stoppered cylinder foam test

30

The test is used for qualitative assessment of the foaming behaviour of solutions.

Procedure

35

The solution to be tested is introduced, avoiding foaming as far as possible, up to the 30 ml mark in a 100 ml measuring cylinder (graduated). It is advisable to hold the cylinder at an angle and allow the solution to run slowly down the wall of the mixing cylinder. The

stopper is then inserted.

If foam has nevertheless formed when introducing the solution, the test is not carried out until the foam has completely disappeared. The stoppered cylinder is shaken vigorously 10 x, and the stopclock is started. The total volume of solution and foam is then read off in ml after previously specified times.

10

Example 1 (comparative)

Activity of phenoxyethanol on bacteria, fungi and mycobacteria at room temperature and 50°C in a quantitative suspension test

15 The activity of phenoxyethanol (as dilution in water) was investigated. The reduction factors are indicated.

Microbe	Concentration used (%)	Room temperature			50°C

MT	0.5	0.00	0.00	0.00	0.00	0.00	0.00

Result:

20

Phenoxyethanol in a concentration of 0.5% by weight is active only on gram-negative bacteria even at a temperature of 50°C and acting for a time of 60 minutes.

Example 2

**Activity of SC 50 on bacteria, fungi and mycobacteria
at room temperature and 50°C in a quantitative
suspension test**

5

The activity of SC 50 was investigated. The reduction factors are indicated:

Microbe	Concentration used (%)	Room temperature			50°C		
		15'	30'	60'	15'	30'	60'
SA	0.1	0.00	0.00	0.96	2.44	4.93	4.70
EC	0.1	0.00	0.54	0.50	3.74	4.95	4.90
PA	0.1	0.00	0.00	0.00	3.55	3.50	4.00
CA	0.1	0.00	0.00	0.00	1.07	1.53	4.20
AN	0.1	-0.35	-0.10	0.40	-0.10	0.30	0.18
MT	0.1	0.00	0.00	0.00	3.10	3.34	3.48

10 **Result:**

At low temperature and using the low concentration of 0.1% by weight, SC 50 has virtually no antimicrobial activity. However, even when used in the low concentration, SC 50 has broad activity on gram-positive and gram-negative bacteria, yeasts and mycobacteria even at 50°C.

Example 3 (comparative)

20 **Lack of activity of SC 50 for *Mycobacterium terrae*
at room temperature**

Suspension tests were carried out without stress. The reduction factors are indicated below.

25

	H ₂ O			10% aqueous EtOH			20% aqueous EtOH			30% aqueous EtOH		
	15'	30'	60'	15'	30'	60'	15'	30'	60'	15'	30'	60'
A	0	0	0	0	0	0	0	0	0	0.83	2.78	4.65
B	0	0	0	0	0	0	0	0	0.66	2.02	4.02	5.52

A) no addition

B) including 0.1% SC 50

5 Result:

The data show that SC 50 in a concentration of 0.1% by weight has good activity for *Mycobacterium terrae* at room temperature only on acting for a time of 60 minutes and in a 30% by weight ethanol solution.

Example 4

Activity of a solution for use for *Mycobacterium terrae* at 50°C

15

Suspension tests were carried out at 50°C with a concentration of 0.1% by weight SC 50. The reduction factors are indicated below:

Action for time of		
15'	30'	60'
4.80	4.66	5.52

20

Result:

The data demonstrate that SC 50 when used in a concentration of only 0.1% by weight is active for *Mycobacterium terrae* at 50°C.

25

Example 5

**Activity of a solution for use for *Mycobacterium terrae*
at 50°C in a quantitative suspension test**

5 The activity of 1.0% by weight citric acid monohydrate
(Comparative Example 5A) and 1.0% by weight citric acid
monohydrate mixed with 0.1% by weight SC 50
(Example 5B), each in deionized water, was investi-
gated. The reduction factors are indicated:

10

	1'	5'	60'
5A	0	0	0.66
5B	0	2.07	5.11

Result:

15 The data demonstrate that the activity of 1.0% by
weight citric acid monohydrate can be reached on use of
0.1% by weight SC 50 at 50°C.

Example 6

Example 6A: Preparation of 1-(n-octyl)glycerol ether

20

23 g (1 mol) of sodium were added in portions over the
course of 4 hours to 325 g (2.5 mol) of 1-octanol while
stirring at 105°C (the temperature did not rise above
120°C during this). The mixture was stirred at 115°C
25 for 1 hour. Subsequently, 110.5 g (1 mol) of 3-chloro-
propane-1,2-diol were added over the course of 2 hours,
and the mixture was stirred at 120°C for 3 hours. After
cooling, the mixture was taken up in 400 ml of diethyl
ether and extracted 3 x with a total of 700 ml of
30 water. The ethereal phase was dried over sodium
sulphate and concentrated. The residue was distilled in
vacuo.

B.p.(15) 137-138°C, 70.5 g, 34.5% of theory, colourless
liquid. Faint characteristic odour. Refractive index
35 $n_D^{20} = 1.4517$ (Beilstein, Volume 1, IV 2758: 1.4515).
The solubility in water is < 0.2% by weight and > 0.1%

by weight.

Example 6B: Direct comparison of the foaming behaviour of SC 50 and 1-(n-octyl)glycerol ether

5

Test method: Test 3 at room temperature

A) 0.1% by weight 1-(n-octyl)glycerol ether from Example 6A in water.

10 B) 0.1% by weight SC 50 in water.

Result of the foam test carried out in duplicate:

Total volume in ml		
Time/minutes	A	B
0	65/70	30/30
1	59/62	30/30
2	59/60	30/30
3	45/44	30/30
5	39/38	30/30
10	30/30	30/30

15 **Result:** Whereas there is virtually no foam with aqueous SC 50 solution, there is pronounced foaming with an aqueous solution of 1-(n-octyl)glycerol ether.

20

Example 7

Citric acid monohydrate + SC 50, activity at 60°C

	7A	7B	7C
SC 50	0.1		0.1
Citric acid \times H ₂ O	1.0	1.0	
Water	98.9	99.0	99.9

Appearance: all solutions are clear, colourless, faint
25 odour

Quantitative suspension test, microbe *M. terrae*, test temperature 60°C.

Neutralizer: phosphate buffer + TSH-NT, initial microbe count 5×10^9 .

Values of RF					
		5'	15'	30'	60'
7A	conc. 50%	4.33	4.23	5.28	5.25
		3.60	3.30	3.12	3.64
7B	conc. 50%	2.40	2.97	4.08	4.77
		1.87	2.46	2.45	2.29
7C	conc. 50%	5.37	5.51	5.28	5.25
		3.03	2.79	4.13	5.25

Result:

- 10 0.1% strength or 0.05% strength aqueous solution of SC 50 has an excellent activity at elevated temperature (e.g. 60°C). Addition of SC 50 markedly improves the Tb activity of citric acid at 60°C.
- 15 The advantages of the SC 50 + citric acid combination are improved activity, wetting, low foam, cleansing action of citric acid, a contribution to the cleansing action of citric acid by SC 50 and improved stability of the aqueous solution (extended endurance).

20

Example 8

Tb activity of Sensiva SC 50 in the alkaline pH range at 22.5°C and 50°C

	8A	8B
SC 50	0.1	
0.5 M NaOH	20	20
Water	79.9	12.8
pH	12.8	12.8

Quantitative suspension test, values of Rf for *M. terrae*

	22.5°C			50°C		
	5'	15'	60'	5'	15'	60'
8A	0	0.53	0.55	1.24	3.62	4.48
8B	0	0	0	0.65	1.17	1.06

SC 50 shows excellent activity on *Mycobacterium terrae*
5 above room temperature even in the alkaline range.
